

SOLUTION

BFS visits nodes level by level.

It starts from a given node, visits all its immediate neighbours first, then moves to the next level.

Main data structure used: QUEUE (FIFO)

BFS Steps

1. Select the starting node.
2. Mark the starting node as visited.
3. Insert it into the Queue.
4. Remove the front node from the Queue.
5. Check all adjacent nodes.
6. Mark unvisited adjacent nodes as visited.
7. Add those nodes to the Queue.
8. Repeat Steps 4–7 until the Queue is empty.
9. The order of visited nodes is the BFS traversal.

Remember: BFS → Queue (FIFO) → Level by Level.
